ELECTRICAL CHANNEL INPUT AND ACCURACY SPECIFICATIONS

Specifications are valid under the following conditions-

- All specifications are valid following a 20 minute warm-up period after turning power ON in the PA900, when operated from the specified source of power and within the specified environmental conditions.
- All specifications in the tables of this section other than those labelled Base Scaling Error are valid for the lifetime of the PA900; Base Scaling Error specifications are valid for up to 2 years after calibration in normal use, or 6 months when continuously used above 75% of the maximum specified voltage or current signal range.
- All specifications are valid at the PA900 terminals.
- DC floor specifications assume that AUTOZERO is ON. If AUTOZERO is OFF add the DC Floor specification per C from the temperature of the last performed INT DC ZERO or when AUTOZERO was last ON (whichever occurred last).
- MAINS specifications are valid for signals with 45Hz to 65Hz fundamental with 20 to 100 harmonics configured and when using AUTO-TRACK bandwidth limiting; otherwise use the AVIONICS or AC specifications as applicable.
- AVIONICS specifications are valid for signals with 300Hz to 900Hz fundamental with 20 to 62 harmonics configured or for signals with 45Hz to 65Hz fundamental with >100 harmonics configured, and when using AUTO-TRACK bandwidth limiting; otherwise use the AC or MAINS specifications.
- Accuracy specifications are valid for Crest Factors <100 (within peak measurable input signal range and bandwidth limitations).
- Harmonics specifications are valid for <(10%/configured number of harmonics) cycle-to-cycle jitter in fundamental frequency and with each harmonic <(100%/harmonic number) of the total signal.

Note:

The specifications listed in this document are superseded by the specifications listed in the PA900 Operating Manual. The Operating Manual additionally contains charts and examples for various specifications.

The No Damage input signal range is that which will not cause immediate damage. Continued use of these levels may reduce reliability and/or future accuracy.

The Measurable input signal range is that which can be measured (the No Damage limits may limit the time for which they may be applied). The maximum measurable level shown is a typical value; the actual measurable maximum level is within $\pm 2\%$ of that shown.

The Specified input signal range is that of continuously applied signal levels for which measurements are guaranteed to be within the specified accuracies. The RMS level is also the maximum rated working signal level for safety purposes.

Accuracy specifications are guaranteed maximum errors. You should round the total maximum error upwards to the next integer count of resolution (e.g. if the total error is 18.3mV and the data is read with 1mV resolution then use 19mV as the maximum error).

All percentages are % of reading unless otherwise described.

When a signal has multiple significant frequency components (e.g. significant DC and AC components), add the relevant specifications for each such component.

V_{DC}, A_{DC}, V_{AC}, A_{AC}, V_{AC+DC}, A_{AC+DC}, V_{RDG}, A_{RDG} etc. indicate the relevant voltage, current etc. reading.

H is the harmonic or spectrum point number.
 N is the configured number of harmonics or spectrum points.
 F or F_{FUND} is the frequency of the signal in kHz.
 F_{BW} is the frequency of the user bandwidth setting in kHz.

INPUT ISOLATION SPECIFICATIONS

MECHANICAL CHANNEL INPUT AND ACCURACY SPECIFICATIONS (MT TYPE)

Specifications are valid under the following conditions-

- All specifications are valid following a 20 minute warm-up period after turning power ON in the PA900, when operated from the specified source of power and within the specified environmental conditions.
- All specifications other than Analog Input Measurement Specifications are valid for the lifetime of the PA900; Analog Input Measurement Specifications are valid for 2 years after calibration.
- All specifications are valid at the PA900 terminals.

Note:

The No Damage input signal range is that which will not cause immediate damage. Continued use of these levels may reduce reliability and/or future accuracy.

The Specified input signal range is that of continuously applied signal levels for which measurements are guaranteed to be within the specified accuracies.

Accuracy specifications are guaranteed maximum errors. You should round the total maximum error upwards to the next integer count of resolution (e.g. if the total error is 18.3mV and the data is read with 1mV resolution then use 19mV as the maximum error).

All percentages are % of reading unless otherwise described.
